Scott Smooth-Wall Modular Steel Bin Panels are engineered to meet present day needs for greater efficiency and economy in both the construction and operation of bulk storage systems.

The modular bins can be assembled to form any size bulk storage bin from 12’x12’ down to 3½’ x 3½’, or smaller. These units can be built to reach vertical walls up to 75 feet.

This storage system is applicable to many different kinds of processing industries which require bulk storage of dry ingredients.

Serving the bulk handling industry since 1966… Let our experience work for you.
MINIMIZES BRIDGING, IMPROVES FLOW OF MATERIALS

- The bin system is weather-tight, and completely smooth on all sides since the connecting bolts used in assembling the bins do not penetrate through the panels.
- There are no projections, corrugations or structural shapes inside or outside the bin walls, which eliminates the opportunity for bridging.

STRONGER THAN COMPETITIVE SYSTEMS

- Fabricated with two heavy-gauge steel walls with 3½ inches of air space between them.
- Stronger, lighter in weight, and will support a greater workload than traditional bulk storage systems.
- Bin systems constructed with Scott Panels will greatly decrease the load on foundations and perimeter walls.

Hopper bottoms can be custom made to fit any size opening and slope.

SAVES LABOR COSTS ON THE JOB SITE

- Modular Bin Panels are welded at the plant, and the actual assembly on site involves only eight bolts per section.
- Scott Storage Bins are erected significantly faster on the job site, with considerable savings in labor costs.
- Scott Panels are pre-finished at the plant with durable aluminized sheets, or tough, weather-resistant enamel, and results in substantial savings in costs to have the completed structure painted.
